TITLE:

Influence of pressure on the magnitude of the threshold field and temperature of the antiferromagnetic transformation of $MnAu_2$

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 43,
no. 6(12), 1962, 2024 - 2027

TEXT: The influence of hydrostatic pressures up to 10000 kg/cm^2 on the Neel temperature T_N and the threshold field H_{th} of $MnAu_2$ is investigated. For this purpose, measurements of the galvanomagnetic effect $\Delta R/R$, the resistance R , the temperature T , and the uniform pressure P were carried out as described by N. P. Grashdankina, L. G. Gaydukov, K. P. Rodionov (ZhETF, 40, 433, 1961). T_N was determined via measurement of $R(T)$ at 1 kg/cm^2 , 4600 kg/cm^2 and at 8850 kg/cm^2 and R_p/R_0 as a function of P at room temperature. The barometric coefficient $R_T^{-1} \cdot dR/dP$ is at room

temperature $7.6 \cdot 10^{-6} \text{ kg/cm}^2$. For T_N the values 364.6°K at atmospheric pressure, 368°K at 4600 kg/cm^2 , and 370.7°K at 8850 kg/cm^2 were obtained. From these data $dT_N/dP = (0.68 \pm 0.05) \cdot 10^{-3} \text{ deg.cm}^2/\text{kg}$ followed.

Measurements of the transverse galvanomagnetic effect $\Delta R_1/R$ and of the specific magnetization σ as functions of H at room temperature and atmospheric pressure gave similar curves. For $8000 \leq H \leq 16000 \text{ oe}$ σ increased rapidly and R decreased with growing H ; for $H \leq 8000 \text{ oe}$ $\sigma \sim H$ and $\Delta R/R = 0$, and for $H > 17000 \text{ oe}$ σ and $\Delta R/R$ tend to saturation. From this it could be concluded that between 8000 and 17000 oe the helicoidal antiferromagnetism is destroyed and ferromagnetic ordering of the spins takes place; $H_{th} = 8000 \text{ oe}$. Measurements of $\Delta R/R = f(H)$ at room temperature and the pressures: atmospheric, 2600 , 5400 , 7025 , 8850 , and 10600 kg/cm^2 were carried out. H_{th} decreases linearly with increasing P : $dH_{th}/dP = -0.67 \pm 0.07 \text{ oe.cm}^2/\text{kg}$. Observed deviations of T_N and H_P can be explained by structural effects. There are 5 figures. f

TITLE: Effect of the antiferromagnetic-ferromagnetic transition on
the galvanomagnetic properties of the compound Mn_{1.88}Cr_{0.12}Sb

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 47,
no. 6, 1964, 2027-2034

TOPIC TAGS: galvanomagnetic property, manganese compound, antifer-
romagnetism, ferromagnetism, Hall effect, thermal emf

ABSTRACT: Results are reported of an experimental investigation of
the temperature dependences of the electric resistance and thermo-
electric power, and also of the temperature and field dependences
of the magnetoresistance ratio ΔR/R and the Hall effect. The mea-
surements were made in single-crystal Mn_{1.88}Cr_{0.12}Sb in the range

Card 1/3

L 22172-65

77--380K, which includes the antiferromagnetic--ferromagnetic transition temperature T_s (319K). The crystals were produced by melting powders of the ingredients, the magnetization isotherms were measured with a Domenicali pendulum magnetometer, and the electric resistivity, its magnetic dependence, and the Hall effect were measured with a potentiometer, using for the Hall effect the technique described by N. V. Volkenshteyn and G. V. Fedorov (FMM v. 2, 377, 1956). Two magnetic field and current directions were used to exclude extraneous effects and the maximum field was 38 kOe. The results show that the transition changes all the properties of the compound markedly. A value $dT_s/dH = (-0.33 \pm 0.04) \times 10^{-3}$ deg/Oe is derived from the shift of the maximum of $\Delta R/R$ with variation of the field. The different characters of the temperature and field dependences of the galvanometric effects in the ferromagnetic and antiferromagnetic regions of a single crystalline structure indicate that the magnetic structure of matter is an essential factor in these effects. AUTHOR: Grazhdankina, N. P.

TITLE: Some features of the pressure coefficient of the electric resistance of substances with spin ordering

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 48, no. 5, 1965,
1257-1261

TOPIC TAGS: ferromagnetism, antiferromagnetism, spin ordering, pressure coefficient, electric resistance, magnetic transition

ABSTRACT: The author reports the results of an investigation of the influence of uniform compression on the electrical resistance of the ferromagnetic compound CrTe, whose magnetic transition temperature decreases with pressure, and of the antiferromagnetic compound MnTe, whose Neel temperature increases with pressure. The measurements were made both above and below the magnetic transformation temperatures (transition temperature 65°C, Neel temperature 37°C). The uniform hydrostatic compression was produced in a high-pressure chamber, with a mixture of transformer oil and kerosene (50-50%) used as the pressure transmitting medium. The

Card 1/2

L 58446-65

ACCESSION NR: AP5013883

method of measuring the electric resistance, temperature, and pressure was analogous to that described earlier (ZhETF v. 40, 433, 1961). The experimental data show that the appearance of spin ordering in a substance gives rise to certain features in the pressure coefficient of the electric resistance. These features are due to the fact that the pressure-induced change in the electrical resistance of ferromagnetics and antiferromagnetics is governed not only by the change in the electron-photon interaction but also by the change in the magnetic state of the substance.

TITLE: Elastic properties of manganese arsenide in the area of magnetic transformations

SOURCE: Zh eksper i teor fiz, v. 50, no. 6, 1966, 1519-1524

TOPIC TAGS: manganese, arsenide, Young modulus, shear modulus, thermal expansion, temperature dependence, magnetic transformation, elasticity

ABSTRACT: The results of measurement of the temperature dependences between room temperature and 460 K, including the magnetic transformation temperatures of the compound ($\theta_1 = 313^\circ\text{K}$ and $\theta_2 = 390^\circ\text{K}$), of the Young and shear moduli and also the thermal expansion coefficient have been presented for manganese.

arsenide. The temperature dependence of the compressibility of MnAs has been calculated on the basis of experimental data on the elasticity modulus. Great changes in the Young and shear moduli and also a sharp change in the compressibility have been observed at temperatures near θ_2 . No anomalous changes in the elastic properties have been observed at temperatures near θ_1 . The results have been discussed in the light of thermodynamic theories of magnetic phase transitions (C. P. Bean, D. S. Rodbell, Phys. Rev. 126, 104, 1962; C. Kittel, Phys. Rev. 120, 335, 1960). Orig. art. has: 6 figures. [Based on authors' abstract] [NT]

TITLE: Physical properties⁶ of Cr-Te-S, Cr-Te-Se²⁷, and Cr-Te-Sb¹ alloys Report, All-Union Conference on the Physics of Ferro- and Antiferromagnetism held 2-7 July 1963 in Sverdlovsk⁷

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 30, no. 6, 1966, 990-993

TOPIC TAGS: ferromagnetism, Curie point, high pressure, crystal lattice parameter, crystal unit cell, chromium compound, tellurium compound, solid solution, sulfur, selenium, antimony, ELECTRIC CONDUCTIVITY

ABSTRACT: The author has determined the Curie point¹ of CrTe at pressures up to 10^4 kg/cm³ and has investigated the Curie points and other properties at atmospheric pressure of solid solutions in which some of the Te atoms in CrTe were replaced by S, Se, or Sb. The work reported here is a continuation of earlier work of the author and others (Zhur. eksperim. i teor. fiz., 40, 433 (1961)), which was undertaken in an attempt to distinguish between the effect on spin ordering of changes in the unit cell volume and changes in the atomic ambience. The experimental technique is described in the earlier paper. The pressure dependence of the Curie point of CrTe was de-

Card 1/2

ACC NR: AP6029116

terminated by three methods; from the break in the curve giving the temperature dependence of the electric conductivity; from the maximum of the galvanomagnetic effect; and by the "thermodynamic coefficient" technique discussed by K.P.Belov (Uspekhi fiz. nauk, 65, 207 (1958)). The rate of change of the Curie temperature T_c of CrTe with changing volume V of the unit cell due to changing hydrostatic pressure was found to be $dT_c/dV = 3.2 \times 10^{24}$ deg/cm³. Substitution of a fraction of the Te atoms in the lattice by Se or Sb also led to a decrease of the unit cell volume V , as well as to changes in other properties of the material, in particular, of the electric conductivity. The value of dT_c/dV , however, was found to be very nearly the same, whether the change in V was due to substitution of Te by Se or Sb, or to hydrostatic pressure. This result was unexpected, because it is believed that superexchange processes involving the conduction electrons play an important role in the interaction of the magnetic atoms in the materials investigated. Orig. art. has: 3 figures and 1 table.

In this case, hydrostatic pressure leads to the formation of a new modification of manganese arsenide, which apparently possesses antiferromagnetic ordering at low temperatures. The Neel temperature of the MnAs high pressure phase grows with the temperature, $d\theta_N/dP = (2.22 \pm 0.07) \cdot 10^{-8}$ degree \cdot kg $^{-1}\cdot$ cm 4 .

TITLE: The Experiment of Concentrating Manganese Ores in Heavy Suspensions and by Flotation Under Industrial Conditions
(Opyt obogashcheniya margantsevykh rud v tyaz...lykh suspenziyakh i flotatsiyey v promyshlennykh usloviyakh)

PERIODICAL: Gornyy zhurnal, 1958, Nr 11, pp 32 - 44 (USSR)

ABSTRACT: The authors give a detailed report on experiments made in a concentration mill of the Mine Administration imeni Voroshilov of the Nikopol'-Marganets Trust, where manganese ores and manganese slime were concentrated on a special experimental assembly. The manganese ore was concentrated in heavy suspension and the ground ferrosilicon was used as weighing compound (fig. 2). This compound was in later experiments replaced by cinder, but the results of concentration were almost identical in both cases (tables 1-11). In the experiment with the flotation of manganese slime, a mixture of sodium carbonate (2.5-3 kg/ton), sulfate soap (1.3-1.5 kg/ton) and oxidized white spirit (0.5 kg/ton) was

Card 1/2

by Flotation Under Industrial Conditions

SOV/127-58-11-8/16

used as a flotation reagent. The scheme of concentration process is given in fig. 4, and the results of flotation - in tables 11-16. The results of both experiments showed the necessity of further improvement and simplification of concentration and flotation processes, though the results already obtained are satisfactory. In connection with these experiments the following scientists are cited by the authors: Z.S. Bogdanova, O.P. Bondarenko; and D.I. Frantsuzov. There are 16 tables, 5 schemes and 2 Soviet references.

TITLE: Ten years of experience in the treatment of early pregnancy toxemia

SOURCE: Medicinski glasnik, no. 2-3, 1965, 70-71

TOPIC TAGS: biologic reproduction, chlorpromazine, drug treatment, human ailment

ABSTRACT: Review of therapeutic experience with 1,231 pregnant women with emesis and hyperemesis gravidatum, including 405 hospitalized ones: 767 were treated mainly with chlorpromazine (Largactil) and 388 with thiethylperazine (Torecan), which was particularly impressive therapeutically in two cases of ptyalism; 281 were treated with prochlorperazine (Stemetil). "Minimum Health Protection During Pregnancy, Delivery, and the Post-Natal Period"

Belgrade, Narodno zdravlje, Vol 22, No 2, 1966, pp 48-53

Abstract: Presented in this article are the detailed data and roles of institutions and services which participate in the health protection of women (dispensaries, health stations, hospital delivery rooms, non-hospital delivery rooms, and midwife field services). Minimal criteria are given for the efficient functioning of these institutions, their cadre, and advisory services. No references.

An analysis of systems for the automatic control of electric arc furnaces. Automatika 2 no. 5:285-291 N '61.

APPROVED FOR RELEASE: Thursday, July 27, 2000 CIA-RDP86-00513R00051661(

S/137/62/000/006/014/163
A006/A101

AUTHOR: Grbić, Radovan

TITLE: An analysis of the automatic control system of electric arc furnaces

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 6, 1962, 35, abstract 6V257
("Avtomatika", 1961, v. 2, no. 4, 208 - 213, Slovenian; Serbo-Croatian and English summaries)

TEXT: On the basis of a general analysis of electric arc furnace development, the importance of their automatic control is illustrated. The capacity of the latest steelmelting electric-arc furnaces attains 200 tons at 7.3 m internal diameter of the shell, 44 Mvamp transformer power and 609 mm electrode diameter. Characteristic features of the d-c and a-c electric arc are described, and calculations are presented on the effect of automatic control upon an increase in efficiency, uniform electric power consumption in electric arc furnaces, and the stability of the whole melting process. A comparison is made of three automatic control systems: i.e. systems based on constant consumed power, constant voltage and constant power factor ($\cos \varphi$).
